

The imperfect Notes app was developed during my Spring 2021 Semester as I was taking Android App Development.

The concept is simple, a notes app that provides an easy going and supportive attitude when it comes to setting your goals. The main attraction is the built in notes format which consists of setting two sub goals under your long term goal. The ceiling goal is what you aim to achieve on a great day, on a day you can really push yourself and make that leap to touch the ceiling. The floor goal is for when things don't go your way, but you still want to make an effort to achieve your goal so you at the very least stand up and get your feet on the floor. This format helps fight our need for perfection which can often get in the way of building any sort of consistency with our goals.

This is the landing screen which includes a greeting to the user, a soothing photo and previously saved and editable goals. The simple note format allows the user to focus on what is important.

Clicking on the three buttons on the top right corner will give the user options, one of which is adding a note. The note adding feature looks as follows.

The user is allowed to add notes of any size or kind. If the user wishes to use the Ceiling/Floor goal format they must simply click on add note, then back out without typing a thing. On the home page there will be a formatted note ready for goals to be added.

There are instructions to the app and more general information on the Guidelines screen which can be accessed via the navigation dots on the upper right hand corner. It looks as follows.
